

OptiSense relocation represents investment in the future

OptiSense GmbH & Co. KG is moving into its new business premises in November. The market leader in miniaturised layer thickness testing systems will therefore have a new address: Annabergstraße 120, 45721 Haltern am See, Germany. The main telephone number +49 2364 50882-0 and your contacts' individual extensions will remain unchanged.

OPTISENSE GMBH

OptiSense GmbH & Co. KG is the world's leading provider of accurate and safe photothermal coating thickness measuring systems.

Solutions include single-sensor devices as well as measuring systems with multiple sensors – all of them contact-free, fast and highly accurate. In addition to measuring systems for industry and mobile hand-held devices, the core business also includes a complete range of services from contract measurements to calibration and maintenance services.

The company headquartered in Haltern am See was founded in 1998 and has a world-wide network of sales partners.

The future headquarters are in the immediate vicinity of the company's current building and offers significantly more space. "With its advantages, such as the direct motorway connection and the proximity to the technology clusters in North Rhine-Westphalia, Haltern am See is the ideal location for us to meet the increasing demands of the future," Dr Jens Heymans, one of OptiSense's three managing directors, said, describing the intensive search for a suitable nearby property. This investment is the result of the company's positive growth in recent years and the resulting need for more space and technical equipment across all OptiSense departments.

Investment follows plans for growth and innovation

During the 6-month construction period, the entirety of the company's new home was refurbished and equipped to reflect the OptiSense corporate identity. The new headquarters offer the product development, production and engineering departments significantly more space, while also more than doubling the space set aside for meetings and training facilities. At the core of the large, new corporate building is the newly integrated, cutting-edge development and testing laboratory, which meets the latest technical and labour law requirements. "With these new premises, we can now not only show our customers the OptiSense product range, but also present it in a tangible way," Dr Heymans explained.

Focus on workplace atmosphere and conditions

During planning, the company attached great importance to equipping the work areas in a modern and pleasing way. This meant laying many metres of data cable and creating optimal light conditions with large window fronts and excellent lighting.

Qualified employees and experts wanted

The move should be completed in November and OptiSense will then immediately take the next steps towards its future growth. "We will be actively looking for more employees to join our company's success story," says Georg Nelke, another OptiSense managing director. The company is primarily seeking for software specialists.
